

## SYSTEM OVERVIEW

The system architecture for the Smart Room Accommodation and Tracking **System** is designed to provide a seamless and efficient experience for managing hostel accommodations. The architecture comprises a robust frontend for user interaction and a powerful backend for handling server-side logic and database management.

### 1. Frontend

- **Technologies:** HTML, CSS, JavaScript
- **Responsibilities:**
  - **User Interface (UI):** The frontend is built using HTML, CSS, and JavaScript to create a dynamic and responsive user interface. This ensures that users, including students, faculty, and administrators, have an intuitive experience when navigating through the application.
  - **Real-Time Updates:** JavaScript enables real-time updates for room availability and occupancy status, enhancing user experience by providing immediate feedback.
  - **Interactive Elements:** The application uses JavaScript to manage interactive elements, such as booking forms and status updates, allowing users to easily make reservations and check the status of rooms.

### 2. Backend

- **Technologies:** PHP, MySQL
- **Responsibilities:**

- **Server-Side Logic:** PHP handles server-side logic, including processing user requests, managing sessions, and executing business rules related to room allocation and booking management.
- **Database Management:** MySQL is used to manage the system's relational database, which stores critical data such as user credentials, room details, booking information, and occupancy status.
- **Security and Authentication:** The backend implements secure user authentication and authorization mechanisms to ensure that only authorized users can access specific features and data.

### **3.Database:**

- **Technology:** MySQL
- **Responsibilities:**
  - **Data Storage:** MySQL serves as the central repository for storing all data related to hostels, including details about rooms, bookings, users, and occupancy status.
  - **Data Integrity:** The database is designed to ensure data integrity and prevent issues like double booking using constraints and transaction management.
  - **Scalability:** MySQL supports scalability, allowing the system to handle increasing amounts of data as the number of users and bookings grows.

## **1. Modules Description**

This section outlines the various modules implemented in the Smart Room Accommodation and Tracking System:

- **Booking and Reservation Module:**

- Allows users to make reservations and manage bookings through an interactive interface.
- Prevents double booking by dynamically updating room availability in real time.
- **Occupancy Tracking Module:**
  - Tracks the occupancy status of each room using a color-coded system (e.g., green for vacant, ash for fully occupied).
  - Provides a visual representation of room status.
- **User Management Module:**
  - User Profiles: Allows users to create and manage their profiles, including personal information, booking history, and preferences.
  - Role-Based Access Control: Implements different access levels for students, hostel managers, and administrators, ensuring that each user has access to relevant functionalities.
- **Admin Dashboard Module:**
  - Offers a centralized dashboard for administrators to manage all aspects of the hostel operations, including bookings, user management, and maintenance requests.
- **Search and Filter Module:**
  - Provides users with advanced search and filtering options to quickly find available rooms based on preferences such as price, amenities, and location.

- Enhances user experience by streamlining the process of finding suitable accommodations.
